

Now that spring is finally here, it's time to work on starting a garden at your [Boise home](#). While it's still too early to put many plants in the ground, you can plan, prepare, and start some plants indoors to transplant when it gets warmer.

Spring is the most active time to be in the garden. Using all the pent-up energy we've accrued over winter, let's head outdoors to clean out and prepare our garden beds, repair hardscaping, do a little pruning and moving, and start the growing season off right. Here are ten things you can do to launch the spring season successfully.

Time for A Spring Inspection

On one of the first warm days of spring, put on your inspector's hat and head out to the garden with a notepad. It's time to see what happened in the garden while you were indoors all winter. Take note of:

- Cold, ice or snow damage on plants
- Beds that will need to be cleaned out
- Hardscaping elements—walls, fences, benches, sheds, trellises—that have shifted, bowed or rotted
- Evidence of new animal burrows from skunks, chipmunks, moles and voles, groundhogs or rabbits. Also, note any deer or rodent damage on woody plants.

Address Hardscaping Issues First

In early spring before the ground is ready to be worked, focus your energy on hardscaping. This is the time to repair damaged retaining walls, level out your stepping stones, clean out your gutters, and fix fences, benches, decks, sheds, trellises, window boxes and raised beds. These tasks are easier to accomplish while your plants are still resting safely dormant.

Early spring is also a good time to plan for and build new raised gardens, widen existing ones, and tidy up your beds' edging. When temperatures allow, add a fresh coat of paint, stain or sealant to any hardscaping elements made of wood.

Do A Thorough Spring Cleanup

Ideally just before your spring bulbs start to pop up, clean the plant debris out of your garden beds. This includes fallen branches, matted down leaves, last year's perennial foliage, ornamental grasses and perennial hibiscus, and any annuals you didn't remove last fall. Maintaining good hygiene in your garden beds will help to keep pests and diseases at bay.

Now is also a good time to clean out debris from your pond or water feature. While you're at it, scrub and sterilize your bird bath and containers before setting them back out into the garden. A 1-part bleach/5 parts water solution should take care of any lingering diseases or insect eggs in your containers.

Feed Your Soil

Talk with someone at your local garden center about which specific products to use, always following package instructions for best results. A good general practice is to top dress the soil with an inch or two of compost, humus and/or manure in early spring just before or as your bulbs are starting to emerge. That's also a good time to sprinkle an organic slow

release plant food like Espoma's Plant-tone or Rose-tone around your perennials and shrubs. Earthworms and other garden creatures will do the job of working these organic materials down into the soil for you.

Get Out A Sharp Pair of Pruners

Spring is a good time to prune some kinds of woody shrubs and trees. We've created a detailed guide for you to follow here: [Pruning Demystified](#). Here are a few highlights:

- Start by pruning out anything that has been broken or damaged by winter ice, snow and cold. Remove dead wood, too.
- Follow the general rule that flowering shrubs which bloom on new wood (this year's growth) can be trimmed in spring. This includes summer flowering shrubs like [butterfly bush](#), [smooth hydrangea](#), [panicle hydrangea](#), [potentilla](#), [rose of Sharon](#), and [roses](#). Their flower buds will be set on the new flush of growth that appears after you prune it.
- Spring is also a good time to shear back evergreens like [boxwood](#) and [arborvitae](#) once their initial flush of new growth has finished emerging.
- DO NOT prune early flowering shrubs and those that bloom on old wood (last year's stems) like [azalea](#), [forsythia](#), [lilac](#), [quince](#), [ninebark](#) and [weigela](#) in spring. If you do, you'll risk cutting off this year's flower buds. You might not be able to see them, but they are there, so resist the urge to prune.

Divide Perennials and Transplant Shrubs

In early spring when they are just beginning to pop up, divide and transplant any perennials that have outgrown their space or grown large enough to split, if desired. In most cases, it's best to divide and move perennials in the opposite season of when they bloom. That means moving summer and fall blooming perennials in spring, and spring blooming perennials in fall. This avoids disrupting their bloom cycle.

Evergreen shrubs can be moved in early spring before their new growth appears or in early fall to give them enough time to re-establish their roots before winter. Deciduous shrubs can be moved almost anytime they are not in bloom and the weather is mild, but generally spring and fall are the preferred seasons for transplanting. If you move them while they are dormant, there will be less stress on the plants and they will be more likely to spring back into action quickly.

Put Out Any Necessary Supports Like Trellises and Stakes

If you've brought a trellis into the garage or shed for winter, early spring is a good time to bring it back out into the garden. Make sure it's sturdy and apply a fresh coat of paint if needed before using it again. If you grow peonies, delphiniums, or any other perennials that require support, set them out now or get them ready to go. Trying to wrangle tender peony stems into a peony ring is tough work once their leaves have unfurled.

Plant Your Spring Containers and Borders

Though most annual flowers need the soil to warm up a bit before planting, some cool weather loving plants like [pansies](#), [nemesia](#), and [osteospermum daisies](#) won't mind if you plant them in the garden early. Fill your spring containers with [sweet alyssum](#), [lobelia](#) and [Supertunia petunias](#), too. You'll find six solutions for cool weather plantings [in this article](#). For most other annuals, it's a good idea to wait until your area's last frost date to plant. Your local Extension Service website lists that date on their website.

Be Ready to Take Cover If Freezing Temperatures Are in The Forecast

If you garden in an area where late spring frosts and freezes are a possibility, be prepared to cover up plants that have tender emerging buds or foliage if freezing temps are in the forecast. If the buds haven't begun to open yet, there's no need to cover them.

Old sheets and towels that have been relegated to the rag pile are a good option, and professional row cover is available for purchase, too. DO NOT cover tender plants with plastic sheeting or tarps. The effect of the plastic touching the newly emerging buds and foliage will magnify the cold's effect, rather than mitigate it.

The Basics of Gardening in Our Area

If you're starting a garden in Boise, your frost-free growing season will start, on average, on May 7. This date will help you start and transplant your seeds at the right time.

It's also important to use the USDA Plant Hardiness Zone Map, which helps you learn the plants that are likely to grow well in your area. The map's zones are determined by the average annual minimum winter temperature in every area of the country, and Boise is in zone 6. So, if you read a plant label or look up information about it online, check to see if it's recommended for zone 6. It's no guarantee, of course, but the plant's chances of thriving in this area will be good.

The Boise area has a relatively short growing season, so many plants will need to be started indoors and then transplanted when there's no longer any danger of frost.
